## Stat2 (phospho Tyr631) Polyclonal Antibody

type I IFNs (IFN-alpha and IFN-beta). Following type I IFN binding to cell surface receptors, Jak kinases (TYK2 and JAK1) are activated, leading to tyrosine phosphorylation of STAT1 and STAT2. The phosphorylated STATs dimerize, associate with ISGF3G/IRF-9 to form a complex termed ISGF3 transcription factor, that enters the nucleus. ISGF3 binds to the IFN stimulated response element (ISRE) to activate the transcription of interferon stimulated genes, which drive the cell in an antiviral state.,PTM:Tyrosine phosphorylated in response to		
Reactivity Human;Mouse;Rat   Applications IHC;IF;ELISA   Gene Name STAT2   Protein Name Signal transducer and activator of transcription 2   Immunogen The antiserum was produced against synthesized peptide derived from human STAT2 around the phosphorylation site of Tyr631. AA range:597-646   Specificity Phospho-Stat2 (Y631) Polycional Antibody detects endogenous levels of Stat2 protein only when phosphorylated at Y631.   Formulation Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.   Source Polycional, Rabbit,IgG   Purification The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen.   Dilution IHC: 1/100 - 1/300. ELISA: 1/40000 IF 1:50-200   Concentration 1 mg/ml   Purity ≥90%   Storage Stability -20°C/1 year   Synonyms STAT2; Signal transducer and activator of transcription 2; p113   Observed Band Cytoplasm. Nucleus . Translocated into the nucleus upon activation by IFN-alpha/beta.   Tissue Specificity Human small intestine,Lung,   Function function:Signal transducer and activator of transcription that mediates signaling by type 1 IFN binding to cell surface receptors, Jak kinases (TYK2 and JAK1) are activated insponylated SIA tyrosine phosph	Catalog No	YP-Ab-01411

	phosphorylated by the receptor associated kinases, and then form homo- or heterodimers that translocate to the cell nucleus where they act as transcription activators. In response to interferon (IFN), this protein forms a complex with STAT1 and IFN regulatory factor family protein p48 (ISGF3G), in which this protein acts as a transactivator, but lacks the ability to bind DNA directly. Transcription adaptor P300/CBP (EP300/CREBBP) has been shown to interact specifically with this protein, which is thought to be involved in the process of blocking IFN-alpha response by adenovirus. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Mar 2010],
